8.5 Packetnets	9
9.0 More information (documentation) on peripheral models and modeling	9

1.0 Model Specific Information

This document provides usage information for an Imperas OVP peripheral behavioral model.

The document is split into sections providing specific information for this peripheral, including any ports for connecting into a platform, registers, other component parts, and configuration options and general information for peripheral modeling with Imperas OVP.

1.1 Licensing

Open Source Apache 2.0

1.2 Location

The KinetisRTC peripheral model is located in an Imperas/OVP installation at the VLNV: [freescale.ovpworld.org / peripheral / KinetisRTC / 1.0](http://freescale.ovpworld.org/peripheral/KinetisRTC/1.0).

2.0 Net Ports

This model has the following net ports:

Table 1. Net Ports

Name	Type	Must Be Connected	Description
Reset	input	F (False)	

3.0 Bus Slave Ports

This model has the following bus slave ports:

3.1 Bus Slave Port: *bport1*

Table 2. Bus Slave Port: bport1

Name	Size (bytes)	Must Be Connected	Description
bport1	0x1000	F (False)	

Table 3. Bus Slave Port: bport1 Registers:

Name	Offset	Width (bits)	Description	R/W	is Volatile
ab_TSR	0x0	32	RTC Time Seconds Register, offset: 0x0		
ab_TPR	0x4	32	RTC Time Prescaler Register, offset: 0x4		
ab_TAR	0x8	32	RTC Time Alarm Register, offset: 0x8		
ab_TCR	0xc	32	RTC Time Compensation Register, offset: 0xc		
ab_CR	0x10	32	RTC Control Register, offset: 0x10		
ab_SR	0x14	32	RTC Status Register, offset: 0x14		
ab_LR	0x18	32	RTC Lock Register, offset: 0x18		

ab_IER	0x1c	32	RTC Interrupt Enable Register, offset: 0x1C		
ab_TTSR	0x20	32	RTC Tamper Time Seconds Register, offset: 0x20		
ab_MER	0x24	32	RTC Monotonic Enable Register, offset: 0x24		
ab_MCLR	0x28	32	RTC Monotonic Counter Low Register, offset: 0x28		
ab_MCHR	0x2c	32	RTC Monotonic Counter High Register, offset: 0x2C		
ab_TER	0x30	32	RTC Tamper Enable Register, offset: 0x30		
ab_TDR	0x34	32	RTC Tamper Detect Register, offset: 0x34		
ab_TTR	0x38	32	RTC Tamper Trim Register, offset: 0x38		
ab_TIR	0x3c	32	RTC Tamper Interrupt Register, offset: 0x3C		
ab_WAR	0x800	32	RTC Write Access Register, offset: 0x800		
ab_RAR	0x804	32	RTC Read Access Register, offset: 0x804		

4.0 Peripheral components in the library

5.0 General Information on Peripheral Models

This document provides usage information for an Imperas OVP peripheral behavioral model.

The document is split into sections providing specific information for this peripheral, including any ports for connecting into a platform, registers etc. and configuration options and general information for peripheral modeling with Imperas OVP.

5.1 Background

Imperas OVP simulation technology enables very high performance simulation, debug and analysis of platforms containing multiple processors and peripheral models. The technology is designed to be extensible: you can create new models of processors, peripherals and other platform components using interfaces and libraries defined by OVP.

The peripheral models created using the OVP APIs run on the Peripheral Simulation Engine (PSE).

The model is typically written in C and compiled into an executable for the PSE processor architecture. The model is compiled for speed of execution and to protect IP. It is dynamically loaded by the simulator at run time.

6.0 Building peripherals easily with Imperas iGen

To aid with model creation, Imperas products include iGen, a model generation tool. iGen takes the laborious and error-prone task of constructing the various hardware model and software element files required for a typical model, and automates this process. iGen creates the needed C files. iGen also creates the C++ SystemC TLM2 interface files needed to run peripheral models in SystemC simulations.

iGen takes as input a simple script specification that includes device internals such as registers and memories, port information, component descriptors, and other elements. iGen then builds the C code model files and user editable templates. These include model frameworks with registers, function calls, memory map, and other items. It ensures that all component parts of the model are well-structured using best practices, and are consistent throughout the files, thus eliminating a common source of errors.

More information on iGen can be found: imperas.com/products.

Please contact Imperas to get access to the Imperas documents: `Imperas_Model_Generator_Guide.pdf` and `Imperas_Peripheral_Generator_Guide.pdf`.

7.0 Peripheral model internals

Each instance of a peripheral model runs on its own virtual machine with an address space large enough for the model. This processor (the PSE) and its memory are separate from any processors, memories and buses

in the platform being simulated; they exist only to execute the code of the peripheral model.

Interception of functions defined in the peripheral model allows the use of features of the host system in the implementation of the behavior of a peripheral. As an example, a real platform might contain a video display device. When simulating this system, it is generally more convenient not to simulate the complete video display device but to use a video package available on the host machine, such as SDL, and to use this to render to the host display. Also models of uarts, ethernet devices and USB components can make use of the host PC resources during simulation, to allow, for example, a simulation to browse the real internet, or the simulation to connect to a real USB device.

8.0 Parts of peripheral models

8.1 Configuring the Peripheral Instance with Parameters

A peripheral can include the behaviour of several configurations. These are controlled when the peripheral is instanced in the platform by setting parameters defined on the peripheral.

8.2 Net Ports

Peripherals may be connected to other peripherals or processors with signal wires (nets). These can be used to act as interrupt signals or used to control behavior between peripherals.

The wires are created in the platform as nets and this net is connected into the peripheral using a net port.

8.3 Bus master ports

A bus master port initiates (and controls the address of) a bus cycle. Bus cycles are generated by behavioral code within the peripheral model.

8.4 Bus slave ports

A peripheral can be defined as having several bus slave ports. The bus slave ports can be split into several address blocks. Each address block be either local memory or memory mapped registers. Both of these can have associated callback functions. A memory mapped register can also be defined as specific read/write access, whether it is volatile, and also whether it is associated with a reset pin and mask. A memory mapped register can also have specific bit fields defined.

8.5 Packetnets

A peripheral can be defined as being connected to packetnet ports. A packetnet is used to model packet based communication such as Ethernet, CAN bus or GSM. A packetnet is created in a platform, then connected to packetnet ports on model instances. A packetnet can have many connections, each able to send or receive packets. A packetnet is used as an efficient method of communication within OVP models.

For more information on modeling with packetnets, please see the peripheral modeling documentation: [OVP_Peripheral_Modeling_Guide.pdf](#), [OVPsim_and_CpuManager_User_Guide.pdf](#) and the example: [\\$IMPERAS_HOME/Examples/Models/Peripherals/packetnet](#).

9.0 More information (documentation) on peripheral models and modeling

More information on modeling and APIs can be found at: OVPworld.org/technology_apis.

Specifics on modeling peripherals can be found: [OVP_Peripheral_Modeling_Guide.pdf](#).

A full list of the currently available OVP documentation is available: OVPworld.org/documentation.
