

# Imperas Guide to using Virtual Platforms

# Platform Specific Information for atmel.ovpworld.org / AtmelAT91SAM7

# Imperas Software Limited

Imperas Buildings, North Weston Thame, Oxfordshire, OX9 2HA, U.K. docs@imperas.com.

Author	Imperas Software Limited
Version	20150901.0
Filename	Imperas_Platform_User_Guide_AtmelAT91SAM7.pdf
Created	26 August 2015
Status	OVP Standard Release

# Imperas Virtual Platform Documentation for AtmelAT91SAM7

9.0 Modifying the Platform	17
9.1 Platforms use C/C++ and OVP APIs	17
9.2 Platforms/Peripherals can be easily built with iGen from Imperas	17
9.3 Re-configuring the platform	17
9.4 Replacing peripherals components	18
9.5 Adding new peripherals components	18
10.0 A voilable Vintual Dietforms	1 0

## 1.0 Virtual Platform: AtmelAT91SAM7

This document provides the details of the usage of an Imperas OVP Virtual Platform. The first half of the document covers specifics of this particular virtual platform. For more information about Imperas OVP virtual platforms, how they are built and used, please see the later sections in this document.

# 1.1 Description

Simple platform of Atmel AT91 ARM7TDMI based system

## 1.2 Limitations

This platform is sufficient to boot Linux

# 1.3 Reference

Rev. 1354D-ATARM-08/02

## 1.4 Licensing

Open Source Apache 2.0

#### 1.5 Location

The AtmelAT91SAM7 virtual platform is located in an Imperas/OVP installation at the VLNV: atmel.ovpworld.org / platform / AtmelAT91SAM7 / 1.0.

# 2.0 Command Line Control of the Platform

# 2.1 Built-in Arguments

Table 1. Platform Built-in Arguments

Attribute	Value	Description
allargs		The Command line parser will accept the complete
		imperas argument set. Note that this option is ignored
		in some Imperas products

When running a platform in a Windows or Linux shell several command arguments can be specified. Typically there is a '-help' command which lists the commands available in the platforms. For example: myplatform.exe -help

Some command line arguments require a value to be provided. For example: myplatform.exe -program myimagefile.elf

# 2.2 Platform Specific Command Line Arguments

uartport		Set the port number to open on the UART and wait for connection	

# 3.0 Processor [arm.ovpworld.org/processor/arm/1.0] instance: ARM7TDMICore

# 3.1 Processor model type: 'arm' variant 'ARM7TDMI' definition

Imperas OVP processor models support multiple variants and details of the variants implemented in this model can be found in:

- the Imperas installation located at ImperasLib/source/arm.ovpworld.org/processor/arm/1.0/doc
- the OVP website: OVP Model Specific Information arm ARM7TDMI.pdf

#### 3.1.1 Description

**ARM Processor Model** 

#### 3.1.2 Licensing

Usage of binary model under license governing simulator usage.

Note that for models of ARM CPUs the license includes the following terms:

Licensee is granted a non-exclusive, worldwide, non-transferable, revocable licence to:

If no source is being provided to the Licensee: use and copy only (no modifications rights are granted) the model for the sole purpose of designing, developing, analyzing, debugging, testing, verifying, validating and optimizing software which: (a) (i) is for ARM based systems; and (ii) does not incorporate the ARM Models or any part thereof; and (b) such ARM Models may not be used to emulate an ARM based system to run application software in a production or live environment.

If source code is being provided to the Licensee: use, copy and modify the model for the sole purpose of designing, developing, analyzing, debugging, testing, verifying, validating and optimizing software which:
(a) (i) is for ARM based systems; and (ii) does not incorporate the ARM Models or any part thereof; and (b) such ARM Models may not be used to emulate an ARM based system to run application software in a production or live environment.

In the case of any Licensee who is either or both an academic or educational institution the purposes shall be limited to internal use.

Except to the extent that such activity is permitted by applicable law, Licensee shall not reverse engineer, decompile, or disassemble this model. If this model was provided to Licensee in Europe, Licensee shall not reverse engineer, decompile or disassemble the Model for the purposes of error correction.

The License agreement does not entitle Licensee to manufacture in silicon any product based on this model. The License agreement does not entitle Licensee to use this model for evaluating the validity of any ARM patent.

Source of model available under separate Imperas Software License Agreement.

#### 3.1.3 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. ISB, CP15ISB) are treated as NOPs, with the exception

Copyright (c) 2015 Imperas Software Limited www.imperas.com

of any undefined instruction behavior, which is modeled. The model does not implement speculative fetch behavior. The branch cache is not modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous (as if the memory was of Strongly Ordered or Device-nGnRnE type). Data barrier instructions (e.g. DSB, CP15DSB) are treated as NOPs, with the exception of any undefined instruction behavior, which is modeled. Cache manipulation instructions are implemented as NOPs, with the exception of any undefined instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

#### 3.1.4 Verification

Models have been extensively tested by Imperas. ARM7TDMI models have been successfully used by customers to simulate ucLinux on Atmel virtual platforms.

#### 3.1.5 Features

Thumb instructions are supported.

#### 3.2 Instance Parameters

Several parameters can be specified when a processor is instanced in a platform. For this processor instance 'ARM7TDMICore' it has been instanced with the following parameters:

Table 3. Processor Instance 'ARM7TDMICore' Parameters (Configurations)

	·	
Parameter	Value	Description
endian	little	Select processor endian (big or little)
simulateexceptions	simulateexceptions	Causes the processor simulate exceptions instead of halting
mips	100	The nominal MIPS for the processor
semihostvendor	atmel.ovpworld.org	The VLNV vendor name of a Semihost library
semihostlibrary	intercept	The VLNV library name of a Semihost library
semihostname	loader	The VLNV name of a Semihost library

## Table 4. Processor Instance 'ARM7TDMICore' Parameters (Attributes)

Parameter Name	Value	Туре
variant	ARM7TDMI	

# 3.3 Memory Map for processor 'ARM7TDMICore' bus: 'mainbus'

Processor instance 'ARM7TDMICore' is connected to bus 'mainbus' using master port 'INSTRUCTION'. Processor instance 'ARM7TDMICore' is connected to bus 'mainbus' using master port 'DATA'.

Table 5. Memory Map ('ARM7TDMICore' / 'mainbus' [width: 32])

Lo Address	Hi Address	Instance	Component
0x0	0xFFFFF	ram0	ram

irq	NIRQ	AIC	AdvancedInterruptController

# 4.0 Peripheral Instances

# 4.1 Peripheral [atmel.ovpworld.org/peripheral/AdvancedInterruptController/1.0] instance: AIC

## 4.1.1 Description

AIC: Advanced Interrupt Controller This model contains an accurate Register set interface. The functionality has only been implemented to sufficiently boot uClinux The Advanced Interrupt Controller has an 8-level priority, individually maskable, vectored interrupt controller, and drives the NIRQ and NFIQ pins of the ARM7TDMI from: The external fast interrupt line (FIQ) The three external interrupt request lines (IRQ0 - IRQ2) The interrupt signals from the on-chip peripherals The AIC is extensively programmable offering maximum flexibility, and its vectoring features reduce the real-time overhead in handling interrupts. The AIC also features a spurious vector detection feature, which reduces spurious interrupt handling to a minimum, and a protect mode that facilitates the debug capabilities.

# 4.1.2 Licensing

Open Source Apache 2.0

#### 4.1.3 Limitations

This model is sufficient to boot Linux

#### 4.1.4 Reference

Rev. 1354D-ATARM-08/02

There are no configuration options set for this peripheral instance.

#### 4.2 Peripheral [atmel.ovpworld.org/peripheral/WatchdogTimer/1.0] instance: WD

# 4.2.1 Description

WD: Watchdog The Watchdog is built around a 16-bit counter and is used to prevent system lock-up if the software becomes trapped in a deadlock. It can generate an internal reset or interrupt, or assert an active

OVP License. Release 20150901.0

level on the dedicated pin NWDOVF. All programming registers are password-protected to prevent unintentional programming, for more information visit http://www.atmel.com/products/at91

#### 4.2.2 Licensing

Open Source Apache 2.0

#### 4.2.3 Limitations

This model is sufficient to boot Linux

#### 4.2.4 Reference

Rev. 1354D-ATARM-08/02

There are no configuration options set for this peripheral instance.

# 4.3 Peripheral [atmel.ovpworld.org/peripheral/PowerSaving/1.0] instance: PS

#### 4.3.1 Description

This model contains an accurate Register set interface. The functionality has only been implemented to sufficiently boot uClinux for more information visit http://www.atmel.com/products/at91

#### 4.3.2 Licensing

Open Source Apache 2.0

#### 4.3.3 Limitations

This model is sufficient to boot Linux

#### 4.3.4 Reference

Rev. 1354D-ATARM-08/02

There are no configuration options set for this peripheral instance.

# 4.4 Peripheral [atmel.ovpworld.org/peripheral/ParallelIOController/1.0] instance: PIO

#### 4.4.1 Description

PIO: Parallel I/O Controller This model contains an accurate Register set interface. The functionality has only been implemented to sufficiently boot uClinux The Parallel I/O Controller has 32 programmable I/O lines. Six pins are dedicated as general-purpose I/O pins. Other I/O lines are multiplexed with an external signal of a peripheral to optimize the use of available package pins. The PIO controller enables generation of an interrupt on input change and insertion of a simple input glitch filter on any of the PIO pins. for more information visit http://www.atmel.com/products/at91

## 4.4.2 Licensing

Open Source Apache 2.0

Page 9 of 20

#### 4.4.3 Limitations

This model is sufficient to boot Linux

#### 4.4.4 Reference

Rev. 1354D-ATARM-08/02

There are no configuration options set for this peripheral instance.

# 4.5 Peripheral [atmel.ovpworld.org/peripheral/TimerCounter/1.0] instance: TC

#### 4.5.1 Description

TC: Timer Counter This model contains an accurate Register set interface. The functionality has only been implemented to sufficiently boot uClinux The Timer Counter block includes three identical 16-bit timer counter channels. Each channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation. The Timer Counter can be used in Capture or Waveform mode, and all three counter channels can be started simultaneously and chained together. for more information visit http://www.atmel.com/products/at91

#### 4.5.2 Licensing

Open Source Apache 2.0

## 4.5.3 Limitations

This model is sufficient to boot Linux

#### 4.5.4 Reference

Rev. 1354D-ATARM-08/02

There are no configuration options set for this peripheral instance.

OVP License. Release 20150901.0

# 4.6 Peripheral [atmel.ovpworld.org/peripheral/UsartInterface/1.0] instance: USART0

# 4.6.1 Description

USART: Universal Synchronous/Asynchronous Receiver Transmitter This model contains an accurate Register set interface. The functionality has only been implemented to sufficiently boot uClinux The USART has its own baud rate generator, and two dedicated Peripheral Data Controller channels. The data format includes a start bit, up to 8 data bits, an optional programmable parity bit and up to 2 stop bits. The USART also features a Receiver Timeout register, facilitating variable length frame support when it is working with the PDC, and a Time-guard register, used when interfacing with slow remote equipment. for more information visit http://www.atmel.com/products/at91

# 5.0 Overview of Imperas OVP Virtual Platforms

This document provides the details of the usage of an Imperas OVP Virtual Platform. The first half of the document covers specifics of this particular virtual platform.

This second part of the document, includes information about Imperas OVP virtual platforms, how they are built and used.

The Imperas virtual platforms are designed to provide a base for you to run high-speed software simulations of CPU-based SoCs and platforms on any suitable PC. They are typically based on the functionality of vendors fixed or evaluation platforms, enabling you to simulate software on these reference platforms. Typically virtual platforms are fixed and require the vendor to modify or extend them. Imperas virtual platforms are different in that they enable you to extend the functionality of the virtual platform, to closer reflect your own platform, by adding more component models, running different operating systems or adding additional applications.

Imperas virtual platforms are created using the Imperas iGen technology, allowing them to be used with Imperas OVP based simulators and also with Accellera/OSCI compliant SystemC simulators and commercial EDA System Design environments that use SystemC.

Virtual platforms include simulation models of the target devices, including the processor model(s) for the target device plus enough peripheral models to boot an operating system or run bare metal applications. The platform and the peripheral models used in most of the virtual platforms are open source, so that you can easily add new models to the platform as well as modify the existing models. Some models are only provided as binary, normally because the IP owner has restricted the release of the model source. In this case, please contact Imperas for more information.

There are typically several generic flavors of the virtual platforms for specific processor families, some targeting full operating systems, such as Linux, and some which focus on Real Time Operating Systems (RTOS) such as Mentor Nucleus or freeRTOS. OVP models of the processor cores are included in the virtual platforms, and for those processors which support mulitple cores SMP Linux is often supported for that virtual platform. For all of these virtual platforms, many of the peripheral components of the platform are modeled, often including the Ethernet and USB components. The semi-hosting capability of the Imperas virtual platform simulator products enables connection via the Ethernet and USB components from the virtual platform to the real world via the x86 host machine.

The Imperas OVP CPU models are written using the OVP Virtual Machine Interface (VMI) API that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. The processor models are Instruction Accurate and do not model the detailed cycle timing of the processor and they implement functionality at the level of a Programmers View of the processor and peripherals and the software running on them does not know it is not running on hardware. Many models are provided as a binary shared object

Copyright (c) 2015 Imperas Software Limited www.imperas.com

OVP License. Release 20150901.0 Page 13 of 20

and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model. The models are run through an extensive QA and regression testing process and most processor model families are validated using technology provided by the processor IP owners. All the models in this platform are developed with the Open Virtual Platforms APIs and are implemented in C.

More information on modeling and APIs can be found on the www.OVPworld.org site.

# 6.0 Getting Started with Imperas OVP Virtual Platforms

Virtual platforms are downloadable from the OVPworld website <a href="OVPworld.org/downloads">OVPworld.org/downloads</a>. You need to browse and look for '<platform processor name> Examples'. You do need to be registered and logged in on the OVP site to download. OVPworld currently provides 32 bit host versions of packages containing virtual platforms.

When downloading, choose, Linux or Windows host. 32 bit packages can be installed and executed on 32 bit or 64 bit hosts. If you require a 64 bit host version please contact Imperas.

For example, for the ARM Versatile Express platform booting Linux on Cortex-A15MP Single, Dual, and Quad core procesors, you would want the download package: 'OVPsim\_demo\_Linux\_ArmVersatileExpress\_arm\_Cortex-A15MP'.

Most virtual platform packages contain the platform and all the processor and peripheral models needed. You will need to download a simulator to run the platform. You can use OVPsim, downloadable from <a href="https://overld.org/downloads">OVPworld.org/downloads</a>, or you can use one of the Imperas simulators (<a href="https://imperas.com/products">imperas.com/products</a>) available commercially from Imperas.

# 7.0 Simulating Software

# 7.1 Getting a license key to run

After you have downloaded you will need a runtime license key before the simulators will run. For OVPsim please visit <a href="OVPworld.org/likey">OVPworld.org/likey</a> and provide the required information and an evaluation/demo license key will be automatically sent to you. If you are using Imperas, then please contact Imperas for a license key.

## 7.2 Normal runs

To run a platform, read the section below on command line control of the platform and the section on setting command line arguments.

# 7.3 Loading Software

For most virtual platforms the platform is already configured to run the default software application/program and there is normally a script to run that sets some arguments. You can then copy/edit this script to select your own applications etc.

The example application programs are typically .elf format files and are provided pre-compiled. There are

normally makefiles and associated scripts to recompile the example applications.

To find more information about compiling and loading software, the following document should be looked at: <a href="mailto:Imperas\_Installation\_and\_Getting\_Started.pdf">Imperas\_Installation\_and\_Getting\_Started.pdf</a>.

# 7.4 Semihosting

In a virtual platform, semihosting is not normally used as there is normally hardware that implements the appropriate functionality - for example I/O will be handled by UARTs etc.

# 7.5 Using a terminal (UART)

If the platform includes one or more UARTs you will need to connect a terminal program to it so that you can see output and type into the simulated program. Review the list of peripherals below and see what configuration options it has been set with. In most cases there is an option to set to instruct the simulator to 'pop up' a terminal window connected to the simulated UART.

# 7.6 Interacting with the simulation (keyboard and mouse)

If the platform has a simulated UART you can normally set a command to get the simulator to pop up a terminal window allowing you to see output from the simulated UART and also allowing you to type characters into the UART that can be processed by the simulated software.

If your simulated platform has an LCD device then you can often configure it to recognize mouse movements and mouse clicks - allowing full interaction.

To see these interactions in action, have a look at some of the available videos available at <a href="https://overld.org/demosandvideos">OVPworld.org/demosandvideos</a>.

# 7.7 More Information (Documentation) on Simulation

To find more information about running simulations and more of the options the simulators provide, the following documents should be looked at:

Imperas Installation and Getting Started.pdf

OVPsim and CpuManager User Guide.pdf

OVP Control File User Guide.pdf

A full list of the currently available OVP documentation is available: <a href="https://overld.org/documentation">OVPworld.org/documentation</a>.

# 8.0 Debugging Software running on an Imperas OVP Virtual Platform

The Imperas and OVP simulators have several different interfaces to debuggers. These include several proprietary formats and also the standard GNU RSP format is supported allowing many compatible debuggers to be used. Below are some examples that Imperas directly support.

# 8.1 Debugging with GDB

A GNU debugger (GDB) can be connected to a processor in a platform using the RSP protocol. This allows

the application program running on a processor to be debugged using a specific GDB for the processor selected. When using the Imperas Professional products many connections can be made allowing a GDB to be connected to all the processors in the platform.

The use of GDB is documented: OVPsim Debugging Applications with GDB User Guide.pdf.

# 8.2 Debugging with Imperas M\*DBG

The Imperas multi-processor debugger can be connected to a platform and through this connection you can debug application programs running on all of the processors instanced within the platform. It is also capable, within this single unified environment, to debug peripheral model behavioral code in conjunction with the processor application programs.

For more information please see the Imperas M\*DBG user guide.

The Imperas multi-processor debugger is also capable of controlling the Imperas Verification Analysis aand Profiling (VAP) tools in real time, making them invaluable to application program development, debugging and analysis.

For more information please see the Imperas VAP tools user guide.

# 8.3 Debugging with the Imperas iGui and GDB

Imperas iGui gives a GUI front end to the use of the GDB debugger. It allows use of all the features of GDB including source level application program debugging on processors.

# 8.4 Debugging with the Imperas iGui and M\*DBG

Imperas iGui gives a GUI front end to the Imperas multi-processor debugger. It provides all the features of this debugger but does so with source level application program debugging on processors and source level debugging of the behavioral code on peripheral components in the platform. A context view shows all the processor and peripheral components within the platform and allows switching between them to examine the state of each at the event at which the simulation was stopped

Imperas iGui provides a menu from which the Imperas VAP tools can be controlled.

# 8.5 Debugging with Eclipse

A standard Eclipse CDT development environment can be connected to one or more processors in a platform (multiple processors require an Imperas professional product). The simulation platform is started remotely or using the external tool feature in Eclipse, opens a debug port and awaits the connection with Eclipse. All features provided by the Eclipse CDT development environment are available to be used to debug software applications executing on the processors in the platform.

The use of Eclipse is documented: OVPsim Debugging Applications with Eclipse User Guide.pdf.

## 8.6 Debugging applications running under a simulated operating system

If the simulated platform is running an Operating System and the platform has a UART or Ethernet etc connection then it is often possible to connect an external debugger and debug the applications running under the simulated operating system.

An example would be a simulated platform running the Linux operating system, such as the MIPS Malta, or ARM Versatile Express. Within the simulated Linux you can start a gdbserver that connects from within the simulation through a UART out to the host PC via a port. Within the host PC you start a terminal program and connect to the port with a debugger such as GDB and can then debug the simulated user application.

# 9.0 Modifying the Platform

# 9.1 Platforms use C/C++ and OVP APIs

The Imperas and OVP simulators execute a platform that is written in C/C++ and that makes function calls into the simulator's APIs. Thus the virtual platform is compiled from C/C++ into a binary shared object that the simulator loads and runs. OVP provides the definition and documentation that defines the C APIs for modeling the platforms, the peripherals and the processors. You can find more information about these APIs on the OVP website and in the OVP API documentation.

# 9.2 Platforms/Peripherals can be easily built with iGen from Imperas

Imperas provides a product 'iGen' that takes an input script file and creates the C/C++ files needed for platforms and peripherals - it creates the C/C++ file that is compiled into the platform or peripheral that is needed as an object file by the simulator. iGen creates the C/C++ files, you then need to add any necessary behaviors or further details etc. For platforms iGen creates either a C platform or a C++ SystemC TLM2 platform. For peripherals iGen creates the C files and also provides a native C++ SystemC TLM2 interface to allow the peripheral to be instantiated in SystemC TLM2 platforms.

Information on iGen is available from: <u>imperas.com/products</u>.

# 9.3 Re-configuring the platform

There will nornmally be several configuration options that you can set when running the platform without the need to change any source. Refer to the section above on command line arguments. If these do not allow you to make the changes you need, then you may need to edit and recompile the source of the platform.

The source of the platform and the source of the peripherals will be installed as part of the packages you are using. The sources are located in the Imperas/OVP installation VLNV source tree. The VLNV term refers to: Vendor (eg arm.ovpworld.org), Library (eg platform), Name, (eg ArmVersatileExpress-CA15), and Version (eg 1.0). To modify the platform, locate the platform source files.

If you are an Imperas user and have access to iGen, we recommend you modify the source script files and regenerate and recompile the C that makes up the platform. Refer to the Imperas iGen model generator

OVP License. Release 20150901.0 Page 17 of 20

guide and the Imperas platform generator guide.

If you are using the C or SystemC TLM2 platforms with OVPsim, then you can edit the C/C++ files, recompile the source directly using the supplied makefiles, and the run the simulator directly with the resultant shared object.

# 9.4 Replacing peripherals components

If you need to replace peripherals, find the appropriate place in the source of the platform, make the change you need, and recompile etc. Look in the library for documentation on available peripherals and their configuration options.

# 9.5 Adding new peripherals components

If you need to add peripherals, find the appropriate place in the source, make the additions you need, and recompile etc. Look in the library for documentation on available peripherals and their configuration options.

If you need to create new peripheral components then use iGen to very quickly create the necessary C/C++ files that get you started. With iGen you can create peripherals with register/memory state in a few lines of iGen source. When adding behavior to the peripherals refer to the OVP API documentation.
